Theory Questions

1.1 Histogram equalisation

Histogram equalisation is a technique for adjusting image intensities to enhance contrast.

1.1.1 How can we see that an image has low contrast when looking at its histogram?

The frequencies are concentrated on the mid range intensities.

1.1.2 What effect does τ_{heq} have when applied on an image?

Improving the contrast by uniformly distributed difference between dark and light values.

1.1.3 What happens when histogram equalisation is applied multiple times on the same image in sequence?

Histogram equalisation enhance the contrast. Applying histogram equalisation multiplied times does not change anything since the intensities is already at the desired values.

1.2 Perform histogram equalisation

Table 1.1: Original image

| 12 | 3 | 1 | 9 |
|----|---|----|---|
| 3 | 0 | 4 | 3 |
| 2 | 6 | 15 | 2 |

| 13 | 8 | 2 | 12 | |
|----|-----|----|----|--|
| 8 | 8 1 | | 8 | |
| 5 | 11 | 15 | 5 | |

1.3 Convolution operator being associative

The "Associative Laws" say that it doesn't matter how we group the numbers when we add or multiply. This property is beneficial for convolution since the grouping of the numbers does not affect the result.

1.4 A MxM kernel

$$\frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix} \qquad \begin{bmatrix} 1 & 1 & 1 \\ 1 & -8 & 1 \\ 1 & 1 & 1 \end{bmatrix}$$
(a) left figure (b) right figure

Figure 1.1: Combined figure

1.4.1 Determine if the convolution kernel are separable by computing their rank

matrix a

$$\begin{split} &\frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix} \stackrel{R3-R1}{\sim} \frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 0 & 0 & 0 \end{bmatrix} \\ &\frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix} \stackrel{R2}{\sim} \frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 1 & 2 & 1 \\ 0 & 0 & 0 \end{bmatrix} \end{split}$$

$$\frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix} \stackrel{R2-R1}{\sim} \frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Which implies that rank(a) = 1. Hence the matrix is separable. We thereby have that

$$MxM = \frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \Rightarrow \frac{1}{4} \begin{bmatrix} 1 & 2 & 1 \end{bmatrix} \frac{1}{4} \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

matrix b

$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & -8 & 1 \\ 1 & 1 & 1 \end{bmatrix} \xrightarrow{R3-R1} \begin{bmatrix} 1 & 1 & 1 \\ 1 & -8 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & -8 & 1 \\ 1 & 1 & 1 \end{bmatrix} \xrightarrow{R2-R1} \begin{bmatrix} 1 & 1 & 1 \\ 0 & -9 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & -8 & 1 \\ 1 & 1 & 1 \end{bmatrix} \xrightarrow{R2-R1} \begin{bmatrix} 1 & 1 & 1 \\ 0 & -9 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1 & 1 \\ 1 & -8 & 1 \\ 1 & -8 & 1 \\ 1 & 1 & 1 \end{bmatrix} \xrightarrow{R1-R2} \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

The matrix is not separable since rank(b) = 2

1.4.2 Why is it helpful to have convolution kernels that are separable?

We are able to increase the computation speed by separating the matrix into vectors.

Chapter 2

Greyscale Conversion

2.1 Implement two functions that manually convert a RGB colour image to a greyscale representation

$$grey_{i,j} = \frac{R_{i,j} + G_{i,j} + B_{i,j}}{3}$$
 (2.1)

$$grey_{i,j} = 0.2126R_{i,j} + 0.7152G_{i,j} + 0.0722B_{i,j}$$
 (2.2)

2.2 Apply your functions on a couple of colour images

We can see clearly from figure 2.1 that the averaging method lack some shades of grey. The averaging method is having trouble with the color red and the color green, since they seem to get the same shade of grey in the picture.

Figure 2.1: Averaging method, luminance-preserving method and original image

Figure 2.2: Subplot

Intensity Transformations

3.1 Intensity transformation on a greyscale image

3.1.1 Explain what this transformation does

The transformation inverts the colors of the image.

3.1.2 Apply the function on an image of your choice and show the result

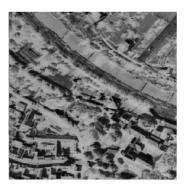

Figure 3.1: subplotIntensity

3.2 Gamma transformation on a greyscale image

3.2.1 Explain what happens with the image intensity values when $\gamma > 1$ and $\gamma < 1$

The image gets lighter when $\gamma < 1$

3.2.2 Different γ values on a greyscale image

```
ax[i].set_axis_off()
plt.show()
return None
subplotImage(imagePath['aerial'])
```
